A complaints case pack the handler can check: the AI drafts, code checks, a person decides

The handler's screen for one complaint: what the AI was allowed to see, the drafted pack with a source for each line, and the deadlines worked out by code. Case HV-007, a disputed card payment with a fake instruction hidden in the email.

What it is

A working tool for a made-up UK bank. The AI drafts a case pack from the complaint and the bank's policy. Code hides personal details first and checks that every sentence quotes something real. A handler fills the gaps and signs off.

On 10 cases kept back until the end

Measure	Result
Quote found in the source	99 to 100%
Right specialist team	90 to 100%
Cost and time per complaint	0.47p, 42 s
Weaknesses found and fixed (page 4)	2

Alexandra Rosenthal, Ankura AI by Design build task, Scenario 1, November 2026. Source: evals/results, held-back set, blind run, 3 repeats. Harbour & Vale Bank is fictional and every customer, policy and complaint is synthetic.

The hours go on assembling facts, so that is where the AI goes. The decision stays with people

Seven steps in handling a complaint, and what I did with each

Step	Value	Risk	What I did
Log and categorise	Medium	Low	Included. Most case systems already do this.
Find and assemble the facts	High	Low	**Built.** Where the hours go, and every line can be checked.
Handover pack for specialists	High	Low	**Built.** Fixes the send-back problem directly.
Deadline tracking	High	None	Code, not AI, because a time limit is a fixed rule.
Spot patterns across cases	High	Low	Prototyped as the team leader view.
Decide the outcome	High	High	Left with people. A regulated decision about a person.
Write to the customer	Medium	High	Left with people. The bank is liable for every word.

The brief's three problems are one problem

A growing backlog, handlers searching notes and policy, and incomplete handovers are all about finding facts, not deciding. A final answer is due within 8 weeks, or 15 business days for most payment complaints. After that the customer can go to the Ombudsman, at £680 a case.

What it could be worth (assumptions, not measurements)

If a handover takes 40 minutes today and 10 with the tool, a team handling 4,000 complaints a month gets back about 2,000 hours, roughly 12 people's time. Ten fewer deadline breaches a month saves £6,800. The pilot on page 5 gets the real figures.

The AI sits in one box of six. It drafts, code checks, and people decide

1 Complaint arrives

Email, call transcript or branch note, as the bank holds it.

2 Code hides details

Names, accounts, phones and emails become labels like [CUSTOMER].

3 AI drafts the pack

Summary, timeline, policy, gaps, flags. Each line must quote its source.

4 Code checks it

Does each quote exist in the source? Deadlines are calculated here.

5 Handler reviews

Accepts, edits or rejects each line. Fills the gaps. Signs off.

6 Specialist decides

Accepts or sends back with a reason. The team leader sees the queue.

The AI tools I used and what I think of them

Tool	Used for	My view
Claude Code	Built the app, tests and scoring scripts with me	Fast. Its mistakes look right until you check. Four are on the right.
Claude Haiku 5.5	Drafts the case pack inside the tool	Good enough for a checked draft at under half a penny a case. Weakest on policy citations, 66%.
Claude Sonnet 5.5	Same 15 cases, bigger model	Slightly better on policy (74%) at eight and a half times the cost.

Four times the AI was wrong, and how I caught it

- Gave a customer and her son the same label because they share a surname. Caught by printing every replacement.
- Hid an incident reference as if it were an account number, which would have broken the link between three complaints.
- Found 341 days overdrawn that my own answer key had missed. My key was wrong, and the change is logged.
- My plan relied on a feature the newest models no longer support. The current docs beat my assumption.

Source: docs/decisions.md; evals/results/eval-dev-sonnet-2026-11-11-0859.md. Next.js and TypeScript on Vercel (London), 51 unit tests and 3 browser tests on every change.

Ten cases held back until the end found two weaknesses. Both are fixed and both are reported

Marked by code against answer sheets written before the prompt

Measure	Tuned	Blind	Fixed
Right specialist team	100%	90 to 100%	90 to 100%
Right deadline rule	100%	**60 to 80%** (corrected keys)	80 to 89%
Vulnerability signs flagged	93%	90%	89 to 90%
Missing information found	93%	85 to 91%	82 to 90%
Policy paragraphs cited	66%	67 to 74%	70 to 73%
Quote exists in the source	100%	99 to 100%	100%
Planted personal details hidden	112 of 112	**78 of 101**	101 of 101
Fake instruction flagged, not followed	1 of 1	n/a	n/a
Cost, time per case	$0.0055, 40s	$0.0063, 45s	$0.0060, 42s

Tuned: the 15 cases the prompt was improved on. Blind: 10 held-back cases, 3 runs, the column to trust. Fixed: the same 10 after the two corrections. The remaining deadline misses are the AI saying "confirm", which sends the case to a person.

Why hiding details missed people

Every miss was a person the bank's record does not know: a boyfriend, a scammer's payee name, children named in an email. A new layer finds people from how the text introduces them. Now 101 of 101, but not blind, so both are shown.

The scam deadline was my rule, and wrong

The Ombudsman's guidance puts scam complaints on the 15 business day clock. My prompt, policy and three answer keys said 8 weeks. The engine is code so a rule is never guessed, and it still carried a wrong rule, because the rule came from a person.

What it cannot do

- A verified quote proves the words exist, not that they support the point.
- "Accept all" is one click. In a pilot I would track review time and remove it if that collapses.
- 25 synthetic cases, no handler time measured, no bank system. The pilot answers all three.

Source: evals/results, eval-heldout-haiku-2026-11-11-0844-blind.md (blind), eval-heldout-haiku-2026-11-11-0919.md (after the fixes), eval-dev-haiku-2026-11-11-0925.md (development set); docs/decisions.md.

Governance is in the code, and the handler's job moves from searching to checking

Controls that are in the code, not in a policy document

Control	What it stops	Rule behind it
Personal details hidden before any AI call	Customer data leaving the bank	UK GDPR, data minimisation
Every sentence quotes its source or is marked red	Made-up facts reaching a decision	Consumer Duty
No field exists for an outcome or compensation	The AI deciding, or being tricked into it	UK GDPR Arts 22A to 22D, DISP 1.4
Handover blocked until every gap is filled or explained	Incomplete handovers	Bank policy CP-6.2 (fictional)
Vulnerability signs recorded before handover	Missing someone who needs extra care	FCA guidance FG21/1
Model and prompt version on every run	Not being able to explain a case later	DISP 1.9 record keeping
Rate limits, a spend cap, an off switch	Runaway cost, or a bad model day	The bank's own controls

A person always confirms the deadline rule, fills every gap, signs off, accepts or sends back, and decides the outcome.

What changes for staff

Role	Now	With the tool
Handler	Searches systems, finds policy, writes from a blank page	Checks a draft with sources, fills gaps, signs off
Specialist	Gets what the handler remembered, chases the rest	Gets a complete pack, accepts or sends back
Team leader	Builds reports by hand	Sees backlog, deadlines and repeat problems live

Pilot

One product line, ten handlers, eight to twelve weeks, against a comparison group. Measure time to handover, send-backs and missed deadlines.

To a worried handler

Nothing leaves your desk without your name on it. If the rejection rate falls towards zero, that is a warning: people have stopped reading.
